

Water Pre-treatment System Replacement Program

We are the water experts, so when it comes to water pre-treatment, Nortec has the experience and the most up-to-date technology to ensure reliability.

During pre-treatment, water goes through dechlorination and softening channels. It is pushed through an activated carbon filter to eliminate the chlorine, and then treated with a duplex softening system removing contaminants and hardness caused by calcium and magnesium minerals.

Why replace your water pre-treatment system?

Energy Savings – Uses kinetic energy, so no electric power is needed.

Optimal Salt and Water Efficiency – Low water consumption; less money spent on salt.

Continuous Clean and Soft Water Supply – Twin tank design allows for clean, soft water even during regeneration.

Longer System Life – Operates only with 100% soft water prolonging longevity of the system.

Quality Equipment – Corrosive resistant valves and tanks endure even the harshest environments.

Low Maintenance – No timers to set, adjust or repair; and no back flushing of carbon filter.
